

Data Ingress to the Turing Data Safe Haven

Intro

Your data is precious to us. The utmost care is taken when transferring the data. However, you will need to follow the guidance to certify we are able to ensure your security.

We have built a Safe Haven solution which uses cloud computing. This uses technology that keeps the data safe and secure. But equally important, there are processes and contractual agreements that enforce this safety, which your organisation has signed up to.

Loading data into the environment

There are two methods of transferring data to the safe haven (in order of preference):

- Microsoft Azure Storage Explorer
- Physical

Under no circumstance should sensitive data be sent via email, including encrypted.

Azure

The Safe Haven is built upon the Microsoft Azure platform. The most convenient way of transferring data from your organisation safely is to use the Azure Storage Explorer from [here](#). You do not require log in credentials to access the Azure Storage Explorer.

Before we can begin...

You will need to confirm that you are able to receive a secure email (we use the service <https://www.egress.com/> - free setup for receiving secure emails).

You will need to send us the public IP address (or range of IP addresses) that are used by the people in your organisation with permission to upload the data. We will ensure that only computers from these IP addresses will be able to connect to our servers.

Checklist:

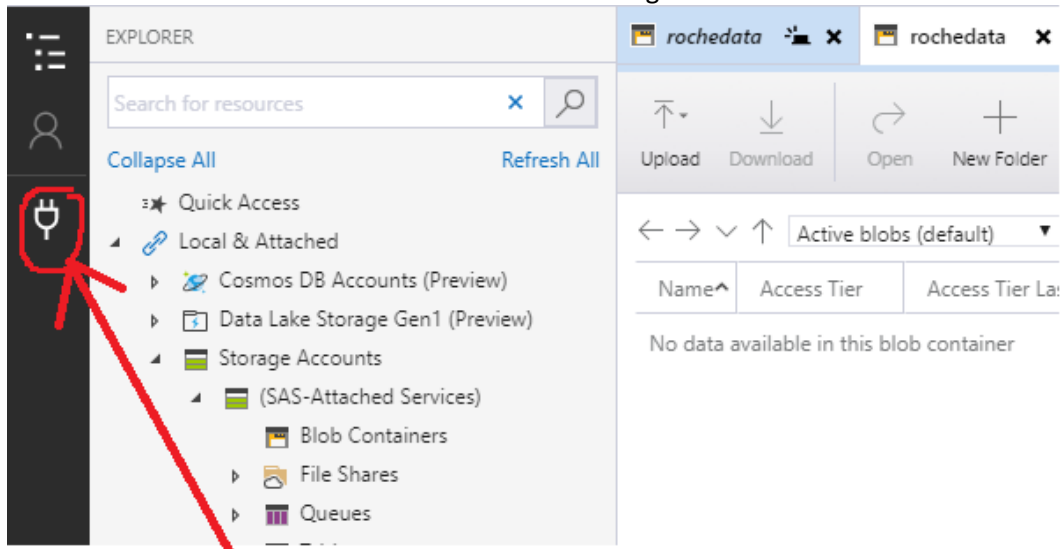

- Access secure emails on work computer
- Send Turing the public IP address (s) of the computer that will conduct the transfer

When we receive the IP address, we will send the person responsible for the data transfer a link via secure email.

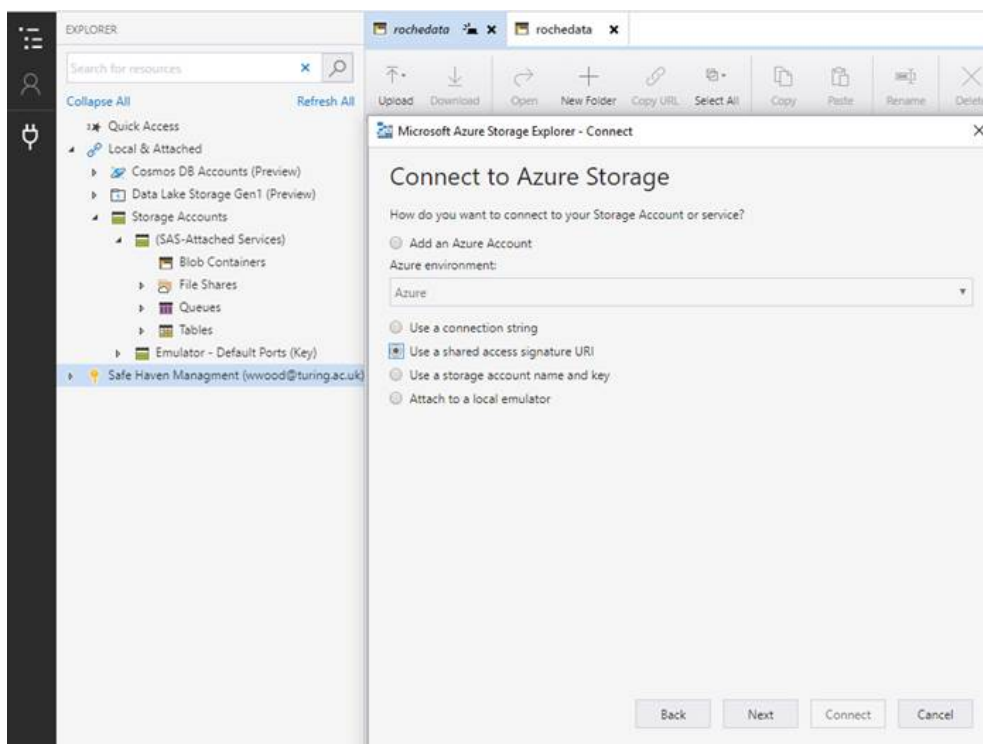

(Whilst the connection between your computers and our repository is one way – you can only send data, not retrieve it – if a malicious actor got hold of the link, they could poison your data)

Connecting to the blob

1. Open Azure Storage explorer
2. Then on the left hand side click on socket image

3. This will open up a prompt box asking how you want to connect. Please select “Use a shared access signature URI” click next and enter the address from the secure email (eg: <https://shmdatastorage.blob.core.windows.net/YOURDATA.....>)

4. Then click connect
5. You should now have access to the storage blob and be able to upload the data

Common issues

You may receive an error:

"this request is not authorized to perform this operation"

– This means that the IP address you have given us is not correct and is therefore being blocked. You can open a browser and type *"what is my IP"* to confirm if the IP address you sent corresponds to what your externally facing IP address actually is, or contact your IT team.

You cannot delete or change a file already uploaded to the staging area

- This is by design. The connection is one way upload only. This is to ensure a malicious actor is unable to tamper with data already transferred on the server.

Physically bring in a disk

Alternatively, you can bring your data to us on a physical device.

Please let us know when you will come to the Turing to deliver the data.
